

11. The Green Transition

Whereas Saskatchewan emits more greenhouse gases on a per capita basis than any other province in Canada;

Whereas currently, 83% of the provincial energy mix comes from non-renewable sources;

Whereas Saskatchewan receives more sunlight than any other province in Canada and has a high potential for wind energy;

Be it resolved the SLP, recognizing the advantages of our unique provincial landscape, promote solar panels and wind farms;

Be it further resolved the SLP implement incentives to reduce emissions through programs like the Feed-In Tariff System;

Be it further resolved the SLP partner with the province of Manitoba to create a hydro power grid;

Be it further resolved the SLP partner with Indigenous communities, to allow for local sustainable activities to thrive and be part of the solution;

Be it further resolved the SLP invest in research and development at Saskatchewan's universities on clean energy;

Be it further resolved the SLP create economic opportunities for canola producers wishing to enter the canola-based bio-diesel market.
